

SentinelX

USAI Global AI Hackathon 2026 — Devpost Submission

Graduate Track (Masters & PhD) | Direction A: Safe Passage — AI Against Digital Exploitation

1. Elevator Pitch

SentinelX is a responsible AI-assisted organizational threat triage and contextual intervention intelligence platform designed for NGOs, intervention organizations, and protection-focused institutions supporting vulnerable individuals facing stalking, cyber-harassment, coercion, exploitation, digital abuse, and contextual threats.

Rather than relying on autonomous surveillance systems or fully automated intervention pipelines, SentinelX was intentionally designed around three distinct, narrowly-scoped flows: an instant no-AI emergency alert, an on-device threat-language detector that never leaves the user's phone, and an analyst-triggered evidence review system. Vulnerable individuals can safely submit reports and evidence through a guided mobile app, while authorized analysts remain fully responsible for all intervention decisions.

The platform combines on-device threat-language classification, Explainable AI evidence analysis, and human-in-the-loop decision-making to help organizations transform fragmented signals into structured intervention intelligence that can support earlier detection of risk patterns and more informed case review processes.

SentinelX was built around a core principle:

AI should assist human judgment in high-stakes safety environments — not replace it.

To support this principle, no AI component ever takes action on a user's behalf. The on-device threat detector only flags; it never escalates. The evidence-analysis AI only runs after an analyst deliberately chooses to review a case. And the emergency alert path uses no AI at all.

Our goal is to help organizations process contextual exploitation and threat-related signals more effectively while preserving accountability, transparency, explainability, privacy, and responsible AI oversight throughout the intervention lifecycle.
